

CONDITIONS FOR HUMAN GOVERNING AUTHORITY

Paper I identifies the authorization responsibility

Assessment and authorization are distinct under the specified contract conditions.
This does not derive completion, valid-root grounding, or root identity.

Augmenting the basis with D determines the judgment; the basis alone does not.

Paper III defines a valid root

Nominal underived charter standing + competence to bear the contract (CanBear).

EXISTENCE

An actual valid decision

Valid governance has been realized.
Completion extracts an actual authorization or closure occurrence.

Valid-root provenance

Valid occurrence standing traces through a permitted delegation path to a valid root.
A rootless delegation cycle is insufficient.

Valid authority exists

At least one valid root (Theorem 9).

MACHINE EXCLUSION

Paper II: representation bridge

D is not represented by the basis.
Spectral/modal discharge or full recovery establishes this premise.
This does not establish confinement.

Paper III: application premises

Faithful bearing must preserve D in the root's independent information basis.
Valid Machine roots must be confined to the specified independent basis.

No Machine valid roots

Preservation is impossible (Theorem 10).

Combine both branches with exhaustive classification:

Every valid root is Human or Machine.

VALID AUTHORITY EXISTS AND EVERY VALID ROOT IS HUMAN

Conditional Human Authority Theorem (Theorem 11).

Additional evidence for plural Human authority

At least two distinct valid roots must exist.
One collective participant can be one root; institutional bearers need a charter mapping.

A Machine may execute a supplied Human decision without becoming a valid root.
Nominal Machine roots remain possible.
